

Title: Cybersecurity Risk Assessment for a Coffee shop

Introduction

This project is about checking for cybersecurity risks at a coffee shop called Blue Mist.

It is for people who are new to cybersecurity.

The coffee shop is not real.

The aim is to find out where Blue Mist might be vulnerable to cyber attacks.

We want to suggest steps to help keep Blue Mist safe online.

We will look at the kinds of risks a small business, like Blue Mist, might face.

Then we will recommend security measures to help prevent these risks.

Blue Mist needs to protect its customers' information and its own business data.

This project will help identify cybersecurity risks and provide recommendations.

Business Overview

1. Blue Mist is a coffee shop that does a few things to make life easier for people who go there.
2. Blue Mist uses a point-of-sale system for payments.
3. The coffee shop also offers public Wi-Fi to customers.
4. Blue Mist stores customer data for a loyalty program.
5. Blue Mist has laptops that the employees use for operations at Blue Mist.

Objective

1. The goal of this evaluation is to figure out assets.
2. We need to look at threats.
3. Then we find weaknesses in these assets.
4. After that we assess the risks involved with these weaknesses.
5. Based on our findings, we will recommend ways to reduce these risks.

Step 1: Identifying Assets

Key assets at Blue Mist include:

1. Point of Sale system that handles customer payments
2. Laptops for employees to use
3. A database with customer information, like names and emails
4. A public Wi-Fi network for customers to use
5. A system to manage inventory levels.

Step 2: Identify Threats

Possible threats to the coffee shop:

1. Phishing attacks can target the coffee shop employees. The coffee shop needs to watch out for these phishing attacks.
2. The coffee shop can get malware infections from downloads. This is a problem for the coffee shop.

3. People can get into the coffee shop Wi-Fi network without permission. This is not good for the coffee shop.
4. The coffee shop has to worry about payment data theft. The coffee shop payment data is very important.
5. The coffee shop employees can misuse the coffee shop data. This is a threat to the coffee shop. The coffee shop needs to make sure the coffee shop employees do not misuse the coffee shop data.

Step 3: Identify Vulnerabilities

The system has some problems.

1. We have an issue to deal with.
2. The system has weaknesses.
3. These are the weaknesses in the system:
4. We use reused passwords for the system.
5. The system is also at risk because we do not separate the network. We use the network for public Wi-Fi and the business network for the system.
6. The system uses POS software.
7. We also do not have antivirus installed on the system.
8. The staff who use the system do not know much about cybersecurity.

Step 4: Risk Analysis

Risk is calculated using:

Risk = Likelihood x Impact

Risk Level	Description
Low	Minimal impact
Medium	Moderate damage
High	Serious damage
Critical	Severe business impact

Step 5: Risk Assessment Table

Asset	Threat	Vulnerability	Likelihood	Impact	Risk Level
POS System	Data Theft	Outdated software	High	High	Critical
Public Wi-Fi	Unauthorised access	No network segmentation	High	Medium	High

Employee laptop	Malware	No antivirus	Medium	High	High
Customer database	Data breach	Weak passwords	High	High	Critical

Step 6: Risk Mitigation

Recommended security measures:

Access Control

- Use unique passwords for all accounts
- Enable Multi-Factor Authentication on all accounts
- Make sure to use a different password, for each account
- Access Control helps keep your information safe.

System Protection

Install antivirus software on your computer.

- Keep the Point of Sale (POS) systems updated regularly.
- Also make sure to update all systems you use.

Network security

To keep things safe, you should separate Wi-Fi from your internal network.

This means you have two networks.

- Use router configurations for your internet connection; this will help protect your internal network and the public Wi-Fi network.
- You must use router configurations to keep your internal network safe from people using the public Wi-Fi.

Employee awareness

- We need to train the staff to recognize phishing emails. This is very important. Phishing emails can be really bad.
- The staff should avoid downloading files from the internet. These unknown files can be very harmful to the computer. The staff should be careful when they see unknown files. They should not download these files.

Conclusion

This risk assessment highlights how even a small coffee shop like Brew Haven can face serious cybersecurity threats. By identifying risks and applying basic security practices, the business can significantly reduce its exposure to cyber attacks.
